

New Portal Technology Allows Customization Of County Web Site

The County released a new portal web site using Oracle's portal technology on March 13th. It features information organized from our customer's point of view and customizable pages with registration capabilities using Oracle's 9iAS portal technology.

County customers can now create an account and then modify the information on the web site to suit their own needs. A teacher can put education links and information on his home page. A businessperson can arrange permit and licensing information on her home page. The information and resources most important to customers can be tailored just for them.

The new portal contains even more information and services, while still offering the same great online services including Property Tax Payment, Weddings On The Web, Lost And Found Pets, and Who's In Jail. A new powerful search engine was also added to the site. When a search of the web site is conducted, not only does it search the County web site, but it also searches other State and local government web sites. This will make it easier and faster for customers to find the information they need.

The new County web site was designed to be your portal to government, and can be seen at <http://www.sdcounty.ca.gov/>.
